

Add a header in each planned query

When a query is launched inside a program (dataflow, Apps script, python...) please add a header to describe the query. That's really important for log analysis and because the cost is directly linked on the database use. So its better if we can detect queries that are not used anymore.

You can find the header description below :

Field	Description
project	The name of the project or program
program	Dataflow, apps script, python, datalab...
function	The name of the function
frequency	the frequency of the query
owner	owner of the program, could be a service account a user login into the tool
SQL	Legacy or standard
Link	filename or link if it's a Google document

Example :

```
/*=====*/
/*project : SolvIA          - program : Apps script    */
/*function : load_daily_freshdesk_tickets             */
/*frequency : Daily          - owner : david.tonda@solvay.com */
/*SQL : Standard                                             */
/* Link: https://script.google.com/a/solvay.com/d/1c8rvwEhtsl85u... */
/*=====*/
```

This list is not exhausted you can add what you want to be identified a query.
