

Filter results

Sometimes you'll want to look at a specific subset of result information, rather than all the results from all your collected data. You can use filters to refine reports to show only results that meet specific criteria. Filters apply globally to a report, so once applied, all visualizations and pages in the report will be filtered to show only information that meets the filter criteria.

You can filter individual responses in the [Data & Analysis](#) module using the same principles outlined on this page. The main difference is that filters applied to reports will remain until you delete them, whereas filters applied to your Data & Analysis module will be disabled once you leave the module.
