

BW - Server List

BW is based on the SAP technology and therefore uses a SAP server available in the SAP Logon list.

Server Name

The server name in the SAP Logon list can be slightly different as it changes depending on the saplogon.ini version in your computer. The code is always the same.

Mostly users connect directly and only to the Production servers :

Code	Name	Description	Client	Report folder
WBP	BW - Production - WBP	Main BW Production server Contains all reporting except HR	400	Role

For the purpose of testing modifications or if you are part of a project, you may be asked to connect to the **quality servers**. Those are copies of the production servers where user acceptance/tests are conducted before the changes are pushed to production.

Code	Name	Description
WBQ	BW - Quality - WBQ	Quality Server linked to the WBP production Server

Quality Server Account

As the Quality Servers are usually copies of the production servers, the user/passwords are the same. If you do not managed to connect with your production user/password, try a previous password. Otherwise, request for a password reset.

Other servers exist but are exclusively used for IT (Development, Sand Box).
