

Enforce uniform bucket-level access

Enforce uniform bucket-level access

Google Definition

This boolean constraint requires buckets to use uniform bucket-level access where this constraint is set to True.

Any new bucket in the Organization resource must have uniform bucket-level access enabled, and no existing buckets in the organization resource can disable uniform bucket-level access.

Enforcement of this constraint is not retroactive: existing buckets with uniform bucket-level access disabled continue to have it disabled.

The default value for this constraint is False. Uniform bucket-level access disables the evaluation of ACLs assigned to Cloud Storage objects in the bucket.

Consequently, only IAM policies grant access to objects in these buckets.

Affected Resources:

- [Cloud Storage](#)

In Solvay...

All resources IAM has to be audited.

Cloud Storage bucket provide the flexibility to provide folder level access.

In order to simplify auditing, all buckets have to implement uniform bucket-level access instead.

No exception will be allowed. All buckets will need to be bucket-level access.
