

Quick Start

Using CDN Pro to accelerate and distribute your content involves the following steps:

1. [Log in](#) to the portal.
2. [Create a property](#), which is the configuration to be deployed to the proxy server(s).
3. [Edit the property](#) if necessary.
4. [Validate the property](#).
5. Optionally [deploy the property to staging servers](#) and make sure the cache behaves as expected.
6. [Deploy the property to production servers](#) and make sure the cache behaves as expected. If you began your free trial of CDN Pro, you must submit at least 5 requests to content deployed to the staging environment before you can deploy to production.
7. [Create an edge hostname](#) for the service hostname(s) in the property.
8. Modify your DNS to add a CNAME record to point your service hostname(s) to the edge hostname.

The following figure shows the steps to follow when using CDN Pro to accelerate your content.
