

PCF [Outdated]

General presentation:

In this page, you can compare site CO₂ "footprints" by the finished products quantities produced or their relative footprint, on each site where Finished products are finished.

⚠ Be careful here we are compiling footprints only on finished product, on the finished product plant, so this footprint compile also footprints coming from other sites by the use of intermediates from other plants)

Filters:

- GBU
- Site
- Year
- Product Sub Group
- Commercial Product
- Finished Product
- Scope

KPI:

- Finished Product count: count number of finished products according to the selected scope (filters).

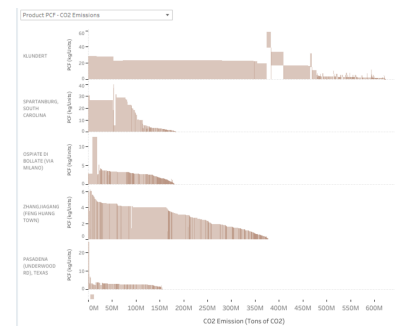

Scope:

Product PCF:

Product PCF Quantity

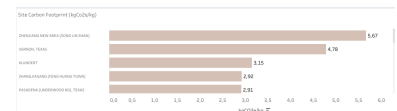

Product PCF CO₂ Emissions

Site carbon footprint:

The purpose of this graph is to know the PCF by site with a split for each scope

PCF value of a site takes into account all products that are produced in the site. The PCF value of the site will not change even if you have one or multiple products selected.

Product carbon footprint:

Display PCF for each finished product per site with a PCF split per scope.
