Purpose

The purpose of this document is to define the conversion approach to create Maintenance Plan and Item in S/4 HANA.

Legacy Maintenance Plan and Item is using a diverse range of formats across the different systems. There are instances where the same Maintenance Plan and Item is duplicated within and across sources, with informal words. This results in data inconsistency. As per SyWay design, EAM Maintenance Plan and Item will be standardized.

Conversion Scope

The scope of this document covers the approach for converting active Maintenance Plan and Item from Legacy Source Systems into S/4HANA following the Maintenance Plan and Item Master Data Design Standard.

The data from legacy system includes:

1. Maintenance Plan (MPLA-WARPL) which have at least 1 valid maintenance Item
2. Maintenance Items (MPOS-WAPOS) that has at least 1 valid task list based on Task List relevancy
3. Maintenance Items (MPOS-WAPOS) that has at least 1 relevant Material (MARA-MATNR), Functional Location (IFLO-TPLNR) or Equipment (EQUI-EQUNR) in reference object or Item in object list based on Material (MARA-MATNR), Functional Location (IFLO-TPLNR) or Equipment (EQUI-EQUNR) relevancy

The data from legacy system excludes:

1. Maintenance Plan (MPLA-WARPL) marked for deletion (MPLA-LVORM) = 'X'
2. Maintenance Items (MPOS-WAPOS) that are not assigned to Maintenance Plan (MPLA-WARPL)

List of Tables to extract for this object is maintained here: [Extract Table Register](#).

List of source systems and approximate number of records

Source	Scope	Source Approx No. of Records	Target System	Target Approx No. of Records
PF2, WP2	Maintenance Plan: Active Maintenance Plan will be extracted from PF2 and WP2	70,000	S/4HANA	70,000
PF2, WP2	Maintenance Items: Active Maintenance Item will be extracted from PF2 and WP2	74,000	S/4HANA	74,000

Additional Information

Multi-language Requirement

Maintenance Plan description will be made available in English.

Multi language is supported for Maintenance Plan. Login via a different language will have its description displayed in the logon language if the language key is maintained in the Maintenance Plan.

Extraction

Extract data from a source into Syniti Migrate. There are 2 possibilities:

1. The data exists. Syniti Migrate connects to the source and loads the data into Syniti Migrate. There are 3 methods:
 - a. Perform full data extraction from relevant tables in the source system(s).
 - b. Perform extraction through the application layer.
 - c. Only if Syniti Migrate cannot connect to the source, data is loaded to the repository from the provided source system extract/report.
2. The data does not exist (or cannot be converted from its current state). The data is manually collected by the business directly in Syniti Migrate. This is to be conducted using DCT (Data Collection Template) in Syniti Migrate

The agreed Relevancy criteria is applied to the extracted records to identify the records that are applicable for the Target loads.

Data Collection Template (DCT)

Target Ready Data Collection Template will be created for Maintenance Plan and Item data with exception of some fields which require transformation as mentioned in the transformation rule.

1. The extracted report will be loaded into the required structure using the DCT.
2. Standardization activities (including deduplication, standardization and additions) will be carried out within the DCT.

Delta Data Management: Initial collection will be done via the report and one-time load to the DCT will be performed. Any delta after the initial collection within the DCT will require business to take due diligence to ensure any subsequent delta cleansing is verified and aligned within the DCT.

Note: All rules specified below should be documented as a **tooltip** in the DC Page.

Transformation

The Target fields are mapped to the applicable Legacy field that will be its source, this is a 3-way activity involving the Business, Functional team and Data team. This identifies the transformation activity required to allow to make the data Target ready:

1. Perform value mapping and data transformation rules.
 - a. Legacy values are mapped to the to-be values (this could include a default value)
 - b. Values are transformed according to the rules defined in
2. Prepare target-ready data in the structure and format that is required for loading via prescribed Load Tool. This step also produces the load data ready for business to perform Pre-load Data Validation

Post-Load Validation

Project Team

Completeness

Task	Action
Verify Count	SyWay A2D Data Team to verify the record count created in target S/4 HANA by accessing post load reports in dspMigrate or standard reports from S/4 HANA.
Verify Logs	Check if there is data that failed to load and perform the necessary actions (e.g. register as post load issue or attempt to load the record again, etc.).

Accuracy

Task	Action
Conversion Accuracy	Verify that the Maintenance plan data in target S/4 HANA were loaded correctly via dspMigrate post load reports or standard reports from S/4 HANA.

Business

Completeness

Task	Action
Verify Count	Download Post Load Reports from dspMigrate and verify that the record count loaded in the target S/4 HANA is the same count as of the endorsed load file.

Accuracy

Task	Action
Conversion Accuracy	Verify that the EAM Maintenance plan data in target S/4 HANA were loaded correctly via dspMigrate post load reports or standard reports from S/4 HANA.

Key Assumptions

- Master Data Standard is up to date as on the date of documenting this conversion approach and data load.
- Maintenance Plan and Item is in scope based on data design and any exception requested by business.
- All data cleansing and preparation has been completed.
- Maintenance Plan collection timeline are the same as Equipment and Functional Location collection. Maintenance Plan collection needs to go hand in hand with equipment and functional location collection. Drop down for equipment and functional location in the maintenance plan DCT relies on the input in equipment and functional location DCT.
- All Maintenance Plans and Items mapped to valid Technical Objects in S/4 HANA
