

PCF Data Readiness Checks

The Data Readiness Check (DRC) is a critical step in the Product Carbon Footprint (PCF) calculation process. It is designed to ensure that the data used in the calculations is **reliable, accurate, of high integrity, and trustworthy**. This step involves thorough validation and verification procedures to confirm that the data meets the stringent quality standards required for accurate and dependable PCF assessments.

By implementing the Data Readiness Check (DRC), SYENSQO can ensure the **robustness of their carbon footprint calculations**, maintain confidence in their sustainability metrics, and achieve their primary goal: ensuring that the data displayed on the dashboard and shared with stakeholders is accurate.
