

3.2 - Task scheduler and planned batches

- a. Task Scheduler
- b. Planned Batches

a. Task Scheduler

The Windows Task Scheduler on a server is a tool dedicated to the management of tasks.

Tasks allow to automatically execute programs or scripts (commonly called batches) according to a certain frequency and at predefined times.

b. Planned Batches

On the backend server where DSCP applications are installed, dedicated tasks and batches are setup in order to trigger some programs.

The execution of batches may :

- directly start
- depend on one (or several) csv file(s) provided by BW. We usually talk about flags :
 1. BW_DYN_PART1_COMPLETE
 2. BW_DYN_PART2_COMPLETE
 3. BW_MASTER_COMPLETE
- wait for the end of other batches.
