Russian waybill output ZWTR

SAP provides the output program and output form as SAP Notes which then may need to be customized.

No test script for this output.

Interface data flow for driver interface (2022)

1. EQMS sends a XML file to WebMethods
2. WebMethods creates an iDoc (message type = SHPMNT, ??? = RVL) in PF1
3. The iDoc updates in the shipment the following information in the tab "Additional data" (more info from the XML should be updated in the shipment in a second step):
 - the driver name,
 - the truck ID,
 - the trailer ID,
 - the driver license number.
4. If the shipment cannot be changed because the shipment is open in change mode, there is a background job that runs every 10 minutes during 7 days to update it later.

This information will be shown on the Rusvinyl waybill output (output type ZTWR).
