

LB SyDL - 4. Views features

SyDatalab is a tool that centralizes visualization features for multiple labs, offering a range of options such as tables, scatter plots, and bar charts, while being configurable to meet the specific needs of each lab. To do so, we will provide a system to create and manage customized views for these labs. A view will be defined by the data displayed, the modules (table, charts and plots) and the customization (default filters, default axes, default columns).
