

Display Calculation View node from HANA view

Since we segregate data of HR and normal developers can't access SAPSR3, therefore, we need to create local view when we create calculation view ([check the best practice how to create CV](#))

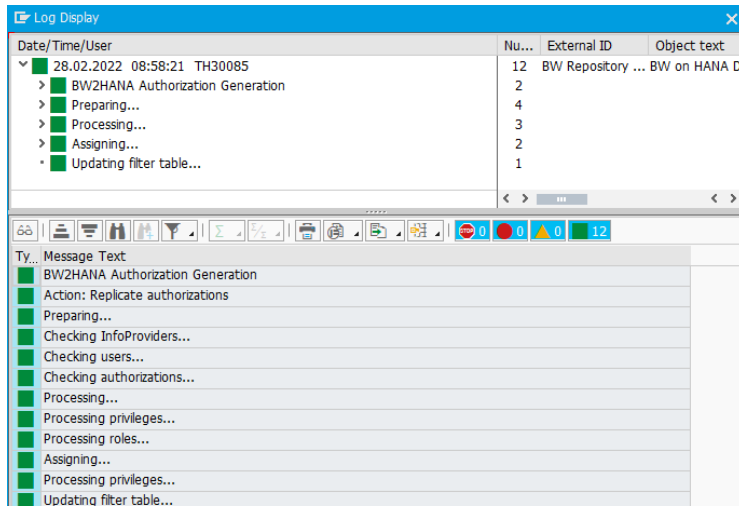

However, in some case, it is possible that the developer didn't generate profile to update privilege to all BW developers. In that case, the developer should do:

1. Tcode: RS2HANA_GEN

Select exclude Y* objects (PaPM objects) and specific your user ID. We can't run all objects for all BW users since it will consume a lot of memory and it will be time out although with background job.

2. Execute it and the log should be all green

3. Do this in each system (WBD, WBQ, WBV, WBP) that you want to preview data in the node.

i Please be aware that the calculation view must be correctly setup the properties and all nodes but create from local system view not SAPSR3. Otherwise, normal developer can't preview the data
