Data, Analytics & AI Platform

Welcome to the DA&AI Wiki!

What we do

The **Data, Analytics and AI Platform** is part of Digital Technologies (DT) and has a clear mandate to scale the data capabilities of Solvay.

The purpose of the DA&AI Platform is to:

- Build and scale new digital capabilities;
- Simplify and modernise our technology landscape;
- Protect and secure technology assets; and
- Establish data as an enterprise asset.

Data will become an enterprise asset through the group Data & Analytics strategy which sets the tune to accelerate value creation while enabling the foundations. This includes:

- Integrated tool chains for data science, from acquisition, organisation, analysis and delivery.
- The model and artefact libraries as well, the data science labs and the AI hub of a modern integrated data and analytics capability.
- A contracts and expertise centre for data science as a service for both the Product Groups and enterprise overall, enabling data science as a core business capability within the business
- Supporting AI as an expertise centre out of D&A while the user cases are maturing

Here you can find the DA&AI Process Maps.
