The below statement details how our dashboard refresh takes place each day.

Our Qlikview applications are split in 3 layers:

- 1) query loading (BW...)
- 2) consolidator layer => data model, aggregate all the results of the step 1)
- 3) dashboard visuals => load data model from step 2

The 3 steps can be launched independently

The reload time displayed under the dashboard on the access point corresponds to the reload of Step 3 ONLY

(ex if we just change a visual without reloading and republish it will change the time on the access point)

The dashboards queries are reloaded during the night from 1 to 9 AM French time.

The dashboard consolidator and dashboard are published when all the concerned queries (for the dashboard) are reloaded

For Analytics we have added a second reload of the dashboard only because Dynasys query took too much time and we could not delay the CRM analytics publish.

So Analytics is published a second time around 12 when the dynasys forecast query is reloaded
