General Description

The KPI **Forecast Accuracy (FA)** evaluates the ability to get a visibility on customers' demand in terms of quantity.

As an input of S&OP process, reliable forecasts constitute the major way to improve the customer satisfaction via an optimized planning of operations. The Forecast Accuracy in this dashboard is calculated based on the **Final Forecast and the Gross History**.

For a particular month, the Forecast Accuracy is calculated for the last **5 months forecast (M-1 ... M-5)**; allowing the possibility to evaluate the accuracy of the forecast with reference to several different forecast periods.

The refresh of the KPI is made every month on the 7th, including the full history.

It is available for all GBUs currently using Dynasys or APO as Demand Planning systems: Aroma Performance, Composite Materials, Novocare, Peroxides, Silica, Soda Ash&Derivatives, Special Chem and Technology Solutions.

- Target Users**
- Global Supply Chain Managers
 - Regional Supply Chain
 - Local Supply Chain
 - Supply Chain Analyst
 - S&OP Manager
 - Purchasing Manager / Buyers
 - Supply Chain Excellence
 - Account Managers

Key figures

Weighted Forecast Accuracy: In addition to the Standard Forecast Accuracy, a second method for calculating the Forecast Accuracy is available.

This measure weights the Forecast Error based on the Gross History of the selected month, according to the selected level of aggregation.

$$\text{Weighted Forecast Accuracy} = \frac{\text{Sum}[\text{Max}(0; 1 - \text{Abs}(\frac{\text{Final Forecast} - \text{Gross History}}{\text{Gross History}})) \times \text{1MonthWeight}]}{\text{Sum Gross History} \times \text{1MonthWeight}} \times 100$$

Levels of aggregation are available with dynamic calculation for each level:

	Material / Ship-to / Distribution Channel	Product / Ship Destination zone / Group of activity	Product / Plant or Product Hierarchy / Sold-To	Sales Rep / Product / Ship-to KA or Product / Sales Rep
Timeframe	Operational purpose	All purposes	All purposes	Operational purpose
Purpose	Measurement to review schedule/forecast accuracy correlation in relation to the schedule adherence at plant level Detailed reviews and Deep dive to understand the gaps	Measurement to review Forecast Accuracy at the Global S&OP meetings (Quarterly) Understanding the needs of a product in a given region Used in the E2E VC dashboard and at the GBU level	Measurement to review planning accuracy in Supply Reviews (actual correlation forecast/planning) Proper procurement of forecasts. Impact on raw material planning Review performance of work centers Note: Product Hierarchy/Sold-to is used for SpP and Peroxides also for their SIP reviews	Measurement for SIP targets: sales representative performance reviews
Roles & Responsibilities	Responsible: none, is a KPI used for the details Accountable: Demand Planner/S&OP Mgr	Responsible: Demand Planner /S&OP Mgr Accountable: Sales Mgr	Responsible: Supply Planners/SC Site Mgr Accountable: Demand Planner/S&OP Mgr	Responsible: GBU SCE /Demand Planner Accountable: Sales Mgr

Purpose: what can we really measure with each dimension/aggregation level in order to understand who is the Key Responsible to track this KPIs.

Roles & Responsibilities: Responsible is considered the person who will look after this KPI in a monthly basis and Accountable is the person whose decisions can leverage a better insight and/or opportunities to improve the KPI

Timeframes (Lag): they depend on how the business is structured and their standard leadtimes, eg. if we talk about a business mostly MTO driven with total replenishment lead times that last around 3 months then the operational purpose is at M+4, if instead it is a business mostly MTS driven M+2 will give an insight on operational purposes. Overall we can say that: M-n: Operational purpose, M-n+2: Procurement purpose and M-n+5: Workload/Contract purpose

Standard Forecast Accuracy: This figure measures the gap between the Gross History and the forecasted quantities. To have a better representation of the forecast error, an absolute value of the forecast error is calculated.

This is also called the **Mean Absolute Percentage Error (MAPE)**.

$$\text{Standard Forecast Accuracy} = \text{Max}(0; 1 - \text{Abs}(\frac{\text{Final Forecast} - \text{Gross History}}{\text{Gross History}})) \times 100$$

Forecast Accuracy = 100%, it means there is no gap between the Forecast and the Gross History
Forecast Accuracy = 0%, it means inaccurate forecasts

Forecast Accuracy M onth-2 is the time between produced forecast and the Gross History (FA June M-2: means forecasts done in April)

Figures

Final Forecast = Total on quantity forecast to be shipped. Final Forecast is the forecast validated after the Demand Review (=Unconstrained Forecast)

Gross History = Customer Demand = Last Customer Request

Dimensions

Distribution Channel = Sales Distribution Channel

GBU Prod. Family = by default the Product Family, but also the Product Hierarchy, the GBU Material Group, or the Forecasts Family

GBU Zone = Mini-Zone = Group of Countries, Specific by GBU

Packaging Type = used on a material

Product Group (PGMI) = Group of products from Dynasys

Product Line 00 = Attribute of a material. There are 6 differents product line levels, corresponding to differents aggregations of products

Sales Rep = Sales Representative from Dynasys Sales Group = DFU owner

Ship-to KA = Ship-to Key Account, final account

Tactical Material = Concatenation of Product Hierarchy and Packaging

Forecast Bias ratio (%): It measures the tendency for a forecast to be consistently higher or lower than the actual value.

Forecast Bias is distinct from the forecast error, in that a forecast can have any level of error, but still be completely unbiased. It is calculated as the average deviation (over or below) of forecasts from actuals.

$$\text{Forecast Bias} = \frac{\text{Sum(Final Forecast)} - \text{Sum(Gross History)}}{\text{Sum(Gross History)}} \times 100$$

If the Forecast is greater than the Gross History, then the Forecast Bias is positive (indicates over forecast)

At the opposite, if the Forecast is lower than the Gross History, then the Forecast Bias is negative (indicates under forecast)

A Forecast Bias = 0, indicates a total absence of gap (bias)

Forecast Bias is a "tracking signal" (positive or negative) and percentage can be above 100%

In many cases, it is useful to know if demand is systematically over- or under-estimated. For example, even if a slight forecast bias would not have a notable effect on store replenishment, it can lead to over- or under-supply at the central warehouse or distribution centers if this kind of systematic error concerns many stores.

How does it work?

1. Select Filters

On top of the dashboard, several different filters allow you to reduce the scope of data for the analysis

DATE 2020 2021 Jan Feb Mar Apr May Jun Jul Aug Sep Oct Nov Dec Month Year

ORGANIZATION: GBU, Group of Activity, Sub-Activity, Company

PLANT: Zone, Country, Plant

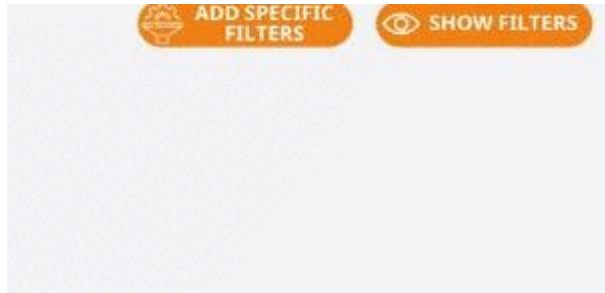

SHIP DESTINATION: Zone, Country, Corporate Group, Ship Destination

PRODUCT: Product Hierarchy, Product, Bulk/Packed, Transport Mode

UNITS: KG, T, EUR, MEUR, PND, KRND, SH-T, USD, NLSD, MLSD

ADD SPECIFIC FILTERS SHOW FILTERS

as well as Specific Filters to select in the dedicated box

2. Select the Forecast Accuracy calculation method

As explained above, the Forecast Accuracy is calculated according to:

- the standard calculation at the detailed level *Material x Distribution Channel x Ship-to*
- the weighted calculation at selected level within the 12 available ones in the drop-down menu (dynamic calculation at displayed level)

3. Select the reference period

On every 6th of each month, a snapshot of the Forecast is taken, keeping the reference of the forecast provided up to 5 months before. This will allow to calculate the FA for periods M-1, M-2, M-3, M-4, and M-5.

[Click here to retrieve the naming conventions by system](#)

4. Check the Forecast Accuracy table

After applying the filters, selecting an aggregation level and a reference period, there is still a way to customize a detail table with the desired Indicators and Dimensions

Forecast Accuracy Table dimensions

Table Indicators: Gross History Final Forecast Forecast Accuracy Forecast Bias

Table Dimensions:

<input type="checkbox"/> Group Of Activity	<input type="checkbox"/> Ship Destination	<input type="checkbox"/> GBU Product Family	<input type="checkbox"/> Tactical Material
<input type="checkbox"/> Plant	<input type="checkbox"/> Ship-to KA	<input type="checkbox"/> Product Group (PGMI)	<input type="checkbox"/> Packaging Type
<input type="checkbox"/> GBU Zone	<input type="checkbox"/> Distribution Channel	<input type="checkbox"/> Product Hierarchy	<input type="checkbox"/> Corporate Group
<input type="checkbox"/> Ship Destination Zone	<input type="checkbox"/> Sales Rep	<input type="checkbox"/> Product	<input type="checkbox"/> GBU
<input type="checkbox"/> Ship Destination Country	<input type="checkbox"/> Product Line 00	<input type="checkbox"/> Material	<input type="checkbox"/> MonthYear

Please note that all dimensions don't match with all aggregation levels.

As a consequence, only the dimensions that are available for the selected aggregation level are displayed.

Mismatching dimensions are disabled to avoid calculation errors.

In the custom table, dimensions in the cyclic depend on the selected aggregation level. If a column is displayed twice because of the cyclic, just deselect the corresponding dimension in the table.

In the pivot table format (Click on the Fast change if you don't see it), the total is available for the 1st column. Move your columns to get the total for the dimension you wish.
