Fatigue

APPLICATIONS		THEORY, KNOWLEDGE, & MODELS		CAPABILITIES
Thermal shock (busbars)	 ***Thermal Shock on Demonstrator*** ***Grades prioritized for Thermal Shock characterization***	Introduction to Fatigue (why does material respect SN ?) Difference between Fatigue and Creep CTD presentation - March'26 VE presentation (more detailed) - March'26 Definition and notations *Physical Background*		Basics about Fatigue tests List of Fatigue data available, SSP Upload Fatigue data (systematically linked to material center) • **Core Labs Capabilities** Electro-mechanical machines are generally used for static tests, as they provide better control over applied force or displacement. For polymers, these machines can also be used for mid-range fatigue tests; note that at Alpharetta, only a contact strain gauge is available for strain acquisition. The film folding tester at Bollate is designed to evaluate the lifespan of films, but it is limited to film materials only and can only test thicknesses between 250 and 350 microns.
Gears	 ***Single tooth Bending tests***	*Influence of Various Factors on Lifetime* 	Effect of Fiber orientation Effect of Temperature Effect of Humidity Effect of Mean Stress / Loading Ratio Effect of Frequency Effect of Weld lines Effect of Sharp Edge / Notch Effect of Over molding Effect of Recycled fibers Effect of ageing Effect of Harsh environments (Chemical, ...) Creep-Fatigue interactions, Self-heating at high frequency Multiaxiality, Triaxiality, Loading Shape Numerical: Effect of Mesh size, Effect of Mesh type Empirical law Stress based approach Energy based approach

• **Corporate Capabilities**

Servo-hydraulic machines are well-suited for fatigue testing, with a dynamic testing range equipped with larger load cells. Strain measurements can be performed using **D**igital **I**mage **C**orrelation (DIC), or with contact / non-contact extensometers.

At the Brussels site, in-house developed demonstrator parts and testing setups enable us to conduct fatigue bending tests on L-shaped samples with various radii and on elongated coupons with or without ribs and weld lines.

- **ADL Capabilities**

Although tooth bending is not a classic fatigue test, this can be used to validate the FE models, with capacity to test higher frequencies.

Tips: The current FE model for fiber filled polymers, can be applied only if the failure mode is slow crack growth controlled failure or brittle failure, which typically occurs at the root of the teeth in gear tooth bending.
