

ERP-1670 System Interface - Source.tab interface to Maestro

Status	Approved
Owner	BROWN-ext, Kevin
Stakeholders	NARAHARI-ext, Bhargavi GARG-ext, Praful RAO-ext, Lakshmana
Jira Request ID	 ERP-1214 - Jira project doesn't exist or you don't have permission to view it.
Jira Development ID	 ERP-1670 - Jira project doesn't exist or you don't have permission to view it.

High- Level Specification

Implementing System	Kinaxis Maestro
Invoked by/Invokes	 ERP-1657 - Jira project doesn't exist or you don't have permission to view it.
Business Process Reference	04.04.06.01. Data provisioning ERP to Maestro

Functional Overview

The Source table stores information about deliveries, as well as information pertaining to contact people at suppliers. This table is referenced from the PartSource table.

Scope and Objectives

The scope of this interface is between Global Integration Suite and Maestro. This document includes details of the Source.tab object.

The objective is to populate the Source and it's referenced tables based on the file provided by Global Integration Suite.

Process Flow Diagram

[/display/ER/System+Interface+-+Reference+Specification+for+Maestro](#)

Step	Description
------	-------------

1	Global Integration Suite transfers transformed Composites / Rest of World data from S/4, and performs some formatting, and sends the data to Maestro.
3	Transferred files will be sent to Maestro's Client SFTP server. This sits outside of the Maestro firewall and is accessible by client using a user id/ password. Files are transferred from this component to the Planning Server SFTP by a Kinaxis automatic process once the trigger file has been placed (see below)
4	Files are moved to this SFTP server automatically, where they await loading into Maestro.
5	Maestro uses the configured DSM (Data Sources and Mapping) setup to load the data into the Source table, with the load initiated either manually or through a scheduled system task.
6	The Data Tables which store information in Maestro

Assumptions

- Data will only come from Global Integration Suite into the Global Data Source, set up in Maestro.

Dependencies

- (SFTP) SFTP credentials needs to be set up, along with the file transfer mechanism.
- Integration suites should provide data in the format described by the Data Sources and Mapping section of this document.

Security, Integrity and Controls

See [Application Architecture Kinaxis Maestro](#) for security requirements for SFTP/REST based authentication and security.

Configuration Requirements

The Data Sources and Mapping for this interface should be configured once, according to the structure in the Data Structure section below.

The Data Model needs to be configured with the Syway-specific fields shown in the Data Model Custom Fields section below.

Special Requirements

None

Design Rationale

The base of this design has been taken from the existing Maestro implementation, as designed during the Advanced Planning System (APS) Project.

A fit-gap analysis was undertaken within Syway, and changes were identified which have been incorporated into the Syway spec as shown.

API Use

The data object provided by either Integration Suite will be **consumed** by Maestro.

For more information see the [Data Integration Document](#).

Data Structure

The following Maestro fields will be populated by the file provided by Integration Suite:

Column Number	Field Name	Technical Field Name	Data Type	Key	Field Type	Autocreate	Description
1	ID	ID	String	Y	ExtractField	Default	Identifier for this source record. Used as the primary key and to link sourcing definitions to other objects.
2	DestinationSite	DestinationSite.Value	Ref String	Y	ExtractField	Default	Site expected to consume supply from this source (referenced Site).

3	SupplierId	Supplier.Id	String	Y	ExtractField	Default	Supplier represented by this source record (reference syntax: <code>Supplier.Id</code>).
4	LeadTimeUnit	LeadTimeUnit.Value	Ref String	N	ExtractField	Default	Unit of measure for lead time values associated with this source (e.g., days, hours).
5	ShipCalendar	ShipCalendar.Value	Ref String	N	ExtractField	Default	Calendar that defines valid shipment days for supplies using this source.
6	TransitCalendar	TransitCalendar.Value	Ref String	N	ExtractField	Default	Calendar used to interpret transit time intervals (defaults to an everyday calendar if not set, depending on system behavior).
7	TransportationMode	TransportationMode.Value	Ref String	N	ExtractField	Default	Mode of transportation used for this source (e.g., truck, sea, air).
8	PreShipLT	PreShipLT	Quantity	N	ExtractField	Default	Time allowed between the supply-side stock date and the ship date to prepare inventory for shipment. Measured in LeadTimeUnit intervals; values < 0 treated as 0. For time-varying values, use a time-phased lead time structure.
9	TransitTime	TransitTime	Quantity	N	ExtractField	Default	Time required to move supply from sourcing location to destination (between ShipDate and DockDate). Typically applicable to transfer sources and interpreted using TransitCalendar intervals (or everyday calendar if TransitCalendar is null). For time-varying values, use a time-phased lead time structure.

File Formats

See *File Formats - SFTP* section in the [Data Integration Document](#).

Data Model Source table settings:

Allow Data update to:		Currency		
Insert, Modify and Delete records	Insert and Modify records only	Allow automatic record creation	Determined by Maestro	Expression
Y	-	N	Y	-

Data Model Source custom fields:

This data object has no custom fields.

Processing Logic

See *Processing Logic - SFTP* section in the [Data Integration Document](#).

Delta or Full Load Requirements

The preference is to do a full load.

For more information on the difference between Full and Delta loads, see the *Full Loads and Delta Loads - SFTP* section in the [Data Integration Document](#).

Interface Alert & Monitoring

See the *Interface Alert & Monitoring - SFTP* section in the [Data Integration Document](#),

Language Requirements

None

User Interface Requirements

Not required.

Sequencing

Reference tables to support Source table data have to be either loaded manually before loading the Source table or at the same time as the Source table is loaded or set to be created automatically in data model or in DSM.

Below tables need to be taken into account before Source table data load:

Table	SyWay configuration
Supplier	Set to allow automatic record creation
Site	Auto create not allowed
Carrier	Not mapped
Calendar	Auto create not allowed
TransportationMode	Set to allow automatic record creation

Volumetrics

Current APS Volume of Source records is 181000.

This value is expected to grow by 1-2% per year.

Performance Consideration

N/A

Error Handling

See Interface Alert & Monitoring section.

Testing

How to Test

Testing of the interface consists of executing the data load into Maestro and validating the results using standard monitoring and validation tools. After each load, the **Data Import and Update** log is reviewed to confirm successful execution and to identify any errors or warnings generated during the load process.

Loaded data is then validated using a **Data Validation** workbook to ensure data completeness and correctness. Validation checks include confirming that required fields are populated, values are displayed in the correct format, and that data quality issues such as blank fields, incorrect quantities, or zero or invalid unit costs are not present. Additional checks may be performed to ensure consistency across key attributes such as part, location, and quantity.

Any errors or data issues identified during testing are documented in the agreed issue tracking mechanism (for example, in Jira or an action log). Most common error types are duplicate errors, missing references, junk values in input fields.

Duplicate errors need further investigation, in case valid data is flagged as duplicate by Maestro during data load and key field combinations have to be looked into for data uniqueness.

Missing references are to be resolved by either providing the missing data that is required to support the file upload (this could be in the form of a file or Maestro settings to allow for the data to be created automatically) or removing the references from the file.

Required corrections are implemented in the middleware (Integration Suite), and the data is reloaded. Validation steps are repeated until no errors are present (or reasons are fully understood).

Test Conditions and Expected Results

1	Data Load Successful	The Data in the data file matches the data in the Maestro table, and there are no errors.
2	Data File contains 0 records	The Data Update should fail with a status of Pending.

3	Data File contains invalid references (or other error)	The Data Update should Fail, the invalid references should be visible in the error log and the records with the error are not loaded into Maestro, and an alert is sent to the Admin team <Or whatever action is needed> Fields for Source.tab which should be checked for invalid references are shown in the Data Structure table above as "Ref String" and are: <table><tr><td>DestinationSite.Value</td></tr><tr><td>LeadTimeUnit.Value</td></tr><tr><td>ShipCalendar.Value</td></tr><tr><td>TransitCalendar.Value</td></tr><tr><td>TransportationMode.Value</td></tr></table>	DestinationSite.Value	LeadTimeUnit.Value	ShipCalendar.Value	TransitCalendar.Value	TransportationMode.Value
DestinationSite.Value							
LeadTimeUnit.Value							
ShipCalendar.Value							
TransitCalendar.Value							
TransportationMode.Value							
4	Data file contains duplicates	The Source.tab file must be checked further for data uniqueness with respect to the key fields, in case data is available in file but not in Maestro					
5	Data file contains MFG sources	The source.tab file must contain the fixed source for make plants.					

Test Considerations/Dependencies

Dependent files should already be loaded into Maestro for these tests to complete. See Sequencing section above.
